

1 Delayed-outcome gap

Partial charge records arrive first

reference capacity labels arrive later

Future observations must not rewrite
an already issued health record

2 Prefix-causal projection

with an exact harm budget

Protected state
prefix-only b_t

Learned candidate
record-specific c_t

Exact online viability set

$[b_t - \delta, b_t + \delta] \cap \mathcal{Y} \cap (-\infty, p_{t-1}]$

project candidate to the closest viable output

output p_t

For any hidden outcome: $|p_t - y| - |b_t - y| \leq \delta$

3 Evidence across settings

Nested cross-domain

12 development domains | 586 cells

11/12 improved | $\Delta\text{MAE} -0.00486$

External mechanism confirmation

6 datasets | 659 cells

5/6 improved | $\Delta\text{MAE} -0.00690$

Decision-cost connection

cost ratio $r = 5 : 1$

7.54% lower | **binary decision stable**

Risk-controlled updates

before reference capacity is available
